

AMENDMENTS TO THE SPECIFICATION

Please replace paragraph three, line 24, on page 5 with the following amended paragraph:

The spool 12 of manual valve 10 is formed with a first control land 70, which opens a connection between port 40 and the exhaust pressure source 24 through port 42 when the manual valve is in the forward state, and closes that connection when the manual valve is in the reverse state. A second land 72 closes port 20 when the manual valve is in the neutral state, opens a connection between the line pressure source 16 through port 20 to passages 74 and 44 and clutch 46 when the manual valve is in the reverse state, and opens a connection between the line pressure source through port 20 and passage 76 to the low pressure port 50 when the manual valve is in the forward state. Land 78 closes port 22 when the manual valve is in the forward state and neutral state. Land 78 opens a connection between the line pressure source 16 to passages 80 and 62 and the direct clutch 64 in the reverse state.
